                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        δõ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is derived from human high molecular weight kininogen (HK) domain 5. HK is a 120 kD glycoprotein which binds with high affinity to endothelial cells, where it is cleaved to two-chain high molecular weight kininogen (HKa) by plasma kallikrein. Has or a synthetic compound comprising part or all of the present sequence may be used in a pharmaceutical composition for inhibiting anylogenesis. Angiogenesis occurs in a number of disease states, such cas tumour formation and expansion, and certain ocular disorders. It can also occur in a rheumatoid joint, hastening joint destruction by allowing an influx of leukocytes. The composition may inhibit and cell apoptosis. Peptides used in the composition may be recombinant peptides, natural peptides, or synthetic peptides. They may also be chemically synthesised, using, for example, solid

                                                                                                                 The present sequence is derived from human high molecular weight kininogen (HK) domain 5. HK is a 120 kb glycoprotein which binds with high affinity to endothelial cells, where it is cleaved to two-chain high molecular weight kininogen (HKa) by plasma kallikrein. Hka or a synthetic compound comprising the present sequence may be used in a pharmaceutical composition for inhibiting anglogenesis. Angiogenesis occurs in a number of disease states, such as tumour formation and expansion, and certain ocular disorders. It can also occur in a rheumatoid joint, hastening joint destruction by allowing an influx of leukocytes. The composition may inhibit anglogenesis by inhibiting endothelial cell proliferation or by inducing endothelial cell apoptosis. Peptides used in the composition may be recombinant peptides, natural peptides, or synthetic peptides. They may also be chemically synthesised, using, for example, solid phase synthesis

                                                                                                                                                                                                                                                                      The present sequence represents a fragment of the light chain of huma high molecular weight kininogen. It is used to produce compounds of the invention. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (DUPO)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; high molecular weight kininogen; glycoprotein; endothelial cell; plasma kallikrein; heavy chain; light chain; analogue; angiogenesis; endothelial cell proliferation; endothelial cell migration; vitronectin.

High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit of endothelial cells with compounds can also be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (DUPO)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                high molecular weight kininogen. High molecular weight kininogen is a 120 kba glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be

The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
                                                                                   The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used to the better that the compounds can also be used to the the compounds can also be used to the the compounds can also be used to the the compounds can also be used to

                                                                                                                                                                                                                                                                                                                             AAR75181 is a partial peptide corresponding to human kininogen fragment 1.2, amino acids 390-520. Partial peptides of bovine human kininogen fragments 1.2, 1 and 2, are used in wound treat agent compons. and act as the active component. The fragments useful in wound treating because they have growth promotion act

High molecular weight kininogen is a 120 kba glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.

The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be inhibit migration of endothelial cells to vitronectin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Where it is cleaved by plasma kallikrein into heavy and light chains.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    that
The present sequence is derived from human two-chain high molecular weight kininogen (HKa) domain 5. HKa is product of high molecular weight kininogen (HK) cleavage by plasma kallikrein. HK is a 120 kD glycoprotein which binds with high affinity to endothelial cells. HW or a synthetic compound comprising the present sequence may be
                                                                                                                                     A pharmaceutical composition used to inhibit angiogenesis, inhibit endothelial cell proliferation, and induce endothelial cell apoptosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                         two-chain high molecular weight kininogen; HKa;

                                                                                             of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' under the sequences have been obtained.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         used in a pharmaceutical composition for inhibiting angiogenesis. Angiogenesis occurs in a number of disease states, such as tumour formation and expansion, and certain occular disorders. It can also occur in a rheumatoid joint, hastening joint destruction by allowing an influx of leukocytes. The composition may inhibit angiogenesis by inhibiting endothelial cell proliferation or by inducing endothelial cell apoptosis. Peptides used in the composition may be recombinant peptides, natural peptides, or synthetic peptides. They may also be chemically synthesised, using, for example, solid phase synthesis methods.
                                                                                                                                                                                                                The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs
                                                                                                                                                                                                                                                                                                     New nucleic acid that is a 5' expressed sequence to
obtaining cDNAs and genomic DNAs that correspond to
diagnostic, forensic, gene therapy and chromosome
                                             ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream
                                                                                                                                                                                                                                                                       Claim 13; SEQ ID 5854; 71pp + CD-ROM; English.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score

mitochondrial processing peptidase (EC 3.4.24.64) 55K protein precursor - potato N;Alternate names: p-55; ubiquinol--cytochrome-c reductase (EC 1.10.2.2) core protein I C;Species: Solanum tuberosum (potato)
C;Date: 28-Mar-1994 #sequence_revision 14-Jul-1994 #text_change 31-Dec-2000
C;Accession: A48529
R;Emmermann, M; Braun, H.P; Arretz, M; Schmitz, U.K.
J. Biol. Chem. 268, 18936-18942, 1993
A;Title: Characterization of the bifunctional cytochrome c reductase-processing peptidas A;Reference number: A48529; MUID:93366812
A;Accession: A48529; MUID:93366812
A;Accession: A48529; MUID:93366812
A;Experimental source: var. Marfona, tuber
A;Note: sequence extracted from NCBI backbone (NCBIP:136740)
C;Superfamily: mitochondrial processing peptidase alpha chain
C;Keywords: hydrolase; metaalloproteinase; mitochondrial matrix; mitochondrion; oxidative
E;1-32/Domain: transit peptide (mitochondrion) #status predicted <TNP>
F;33-534/Product: mitochondrial processing peptidase 55K protein #status experimental 
Search completed: July 6, Job time: 644 sec
